

A New Way to Study Clinical Psychological Science

April 18, 2012

Founding Editor Alan E. Kazdin wants APS's newest journal, *Clinical Psychological Science (CPS)*, to be a multidisciplinary, interdisciplinary, international publication that draws from a variety of fields and methods. "It's not that we want diversity for diversity's sake," Kazdin says. "We want to solve problems, and that's what requires the diversity."

Traditionally, clinical journals have been highly specialized. Such journals are great for finding the latest research on a specific subject, such as addiction, or personality disorders, but until recently, there has not been a single journal that collects the latest research in all areas of clinical psychology.

"*CPS* publishes a broad range of research because we're interested in solving problems of a certain kind, and so many disciplines and areas speak to this," Kazdin says in this video interview. "We want to bring the best of psychological science to handle clinical phenomena."

More on *CPS* and Kazdin's vision for the future of clinical psychological science is available in Kazdin's March *Observer* [interview](#) and [editorial](#) and APS's Twitter and Facebook [Q&A with Kazdin](#).
